

ONEDCN is an end-to-end solution to manage playlists and content distribution from a central server to cinema servers located at every cinema site and connected to it's network and the internet. The cinema server is available in two sizes, Mark I and Mark II, and gets deployed as integrated part of your d-cinema equipment and interacts with the existing screen management or theater management solution. Mark I is ready to be applied for advertising service and can be extended for trailering service.
